

Boston Canal/Vermilion Bay Bank Protection (TV-09)

Project Status

Approved Date: 1992 **Cost:** \$1 million
Project Area: 466 acres **Status:** Completed
Net Benefit After 20 Years: 378 acres Nov. 1995
Project Type: Shoreline Protection and Vegetative Plantings

Location

The project encompasses 466 acres of brackish marsh along approximately 16 miles of Vermilion Bay's northern shoreline adjacent to Boston Canal. Running from the Oaks Canal to Mud Point, the project is located roughly 6 miles southeast of Intracoastal City, Louisiana, in Vermilion Parish.

Problems

Construction of the Gulf Intracoastal Waterway, Boston Canal, and oilfield canals has greatly increased tidal exchange between Vermilion Bay and the adjacent marshlands to the north, particularly near their confluence with Vermilion Bay. This tidal exchange, combined with the effects of wave action from the bay and boat wake from traffic on the canal, has contributed to significant shoreline erosion along the Vermilion Bay shoreline. This same set of problems has also caused shoreline erosion along Boston Canal, particularly near its confluence with Vermilion Bay.

Restoration Strategy

Rock dikes configured as sediment traps were constructed along the shoreline at the mouth of Boston Canal to promote sediment deposition and protect the shoreline and adjacent wetlands from continued wave-induced erosion.

Vegetation was planted along 14 miles of the Vermilion Bay shoreline to act as a wave buffer and decrease shoreline erosion rates.

Planted smooth cordgrass (*Spartina alterniflora*) protecting the Vermilion Bay shoreline.

Progress to Date

Following the construction of the rock dikes, as much as 4.5 feet of sediment has vertically accreted in the lee, or wind-sheltered regions, of the structures. The dikes and vegetative plantings have increased vegetation cover, resulting in 57 acres of land growth.

The shoreline has been stabilized at the mouth of Boston Canal.

The survivorship and vegetation cover percentage along the shoreline were more pronounced in areas where native vegetation did not exist. Survivorship and percent cover were least pronounced when marshhay cordgrass (*Spartina patens*) was planted in established stands of roseau cane (*Phragmites australis*). Overall survivorship of planted smooth cordgrass (*Spartina alterniflora*) was over 90% after 12 months. Current coverage is nearing 100%. This project is on Priority Project List 2.
